

Adding a Security Exception for Java using Mac OS

1. Using the “Apple” menu, choose “System Preferences”

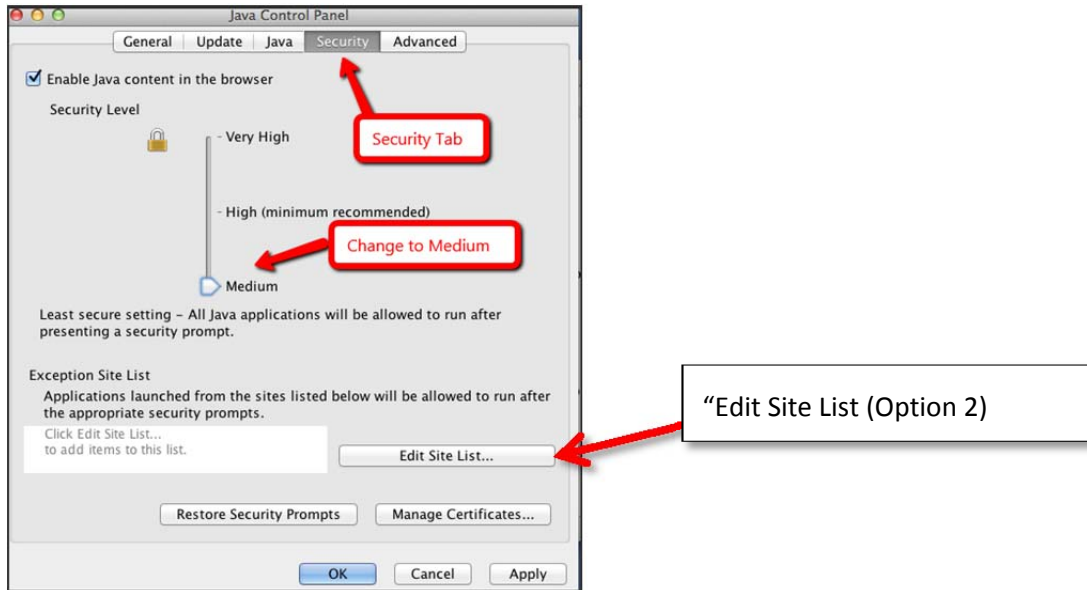

2. Find “Java” as shown below. Click on “Java”. The Java Control Panel will open.

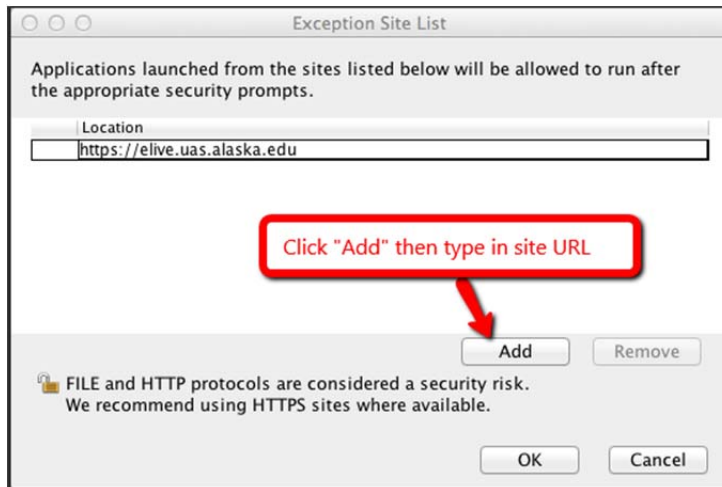

3. ~~You may need to update Java to the most recent version. Click on the “Update” tab — if you already have the latest version it will verify this~~

There is no need to update our Java for Collaborate – Collaborate will run in Java version 7 and above

4. **OPTION ONE** – changing the Java Security Setting to Medium for all Sites. You will still get a warning each time a Java program runs.
Click on the Security tab. Use the slider to change the setting to “Medium”.
Click OK and close the Java Control Panel

5. **OPTION TWO** – Add an exception for a specific site.
Click the Security Tab. Edit Site List to include URL of the site in question (make sure you trust the site – you will get warnings). (Note – if you don't see “Edit Site List” as shown above – then change the setting to Medium. After editing the site list you will be able to change the setting to high again.)

Click “Edit Site List” then “Add” in the window that opens up. Type in only the domain name (ending in .edu or .com and so forth) not the address of a page on the site. For example, to add UAS Elluminate/Collaborate sessions to the list of secure sites – type in <https://elive.uas.alaska.edu> (notice the “s” in https)
After you add the URL to the exception list OR set the security setting to Medium, the Java application should run (with a security warning).
